

HUMEDAD DEL AIRE

Análisis Año 2008
AVANCE

CABILDO  TENERIFE

La red de estaciones agrometeorológicas del Cabildo Insular de Tenerife, que gestiona el Servicio Técnico de Agricultura y Desarrollo Rural, ha sido diseñada como apoyo a trabajos propios y en especial a la elaboración de los avisos fitosanitarios y las recomendaciones de riego que se difunden semanalmente a través de www.agrocabildo.com.

Los estudios climáticos realizados en años precedentes con los datos de cada estación, presentan un análisis detallado de las observaciones meteorológicas. Se trata de un trabajo muy laborioso por lo que se pone a disposición de los usuarios muchos meses después de transcurrido el año. Por ello, este año adelantamos la información en estudios más reducidos a modo de avance de las observaciones climáticas realizadas.

Los parámetros estudiados son: precipitación, temperatura, humedad relativa, velocidad del viento, radiación solar directa y evapotranspiración potencial.

Para ello se han utilizado los datos de las estaciones que componen nuestra red agrometeorológica, así como los de algunas estaciones de otras instituciones, especialmente del Instituto Canario de Investigaciones Agrarias (ICIA), Instituto de Energías Renovables (ITER) y Museo de Ciencias Naturales, a que expresamos nuestro agradecimiento.

José Manuel Hernández Abreu
Jefe del Servicio de Agricultura y Desarrollo Rural del Cabildo de Tenerife

Las humedades del aire medias anuales en el año 2008 han sido inferiores a los valores medios normales, excepto en la costa norte a noroeste y en la Comarca de Daute. Son notables, las humedades medias anuales moderadas en las medianías en las vertientes oeste a sureste de la isla. En general, las humedades medias trimestrales en invierno han sido inferiores a las humedades medias normales, excepto en la Comarca de Daute y en la costa noroeste a noreste; las humedades medias trimestrales en primavera han sido inferiores a las humedades medias normales, en particular, en las medianías; las humedades medias trimestrales en verano han sido superiores a las humedades normales en las vertientes noroeste a noreste; las humedades medias trimestrales en otoño han sido superiores a las humedades medias normales, excepto en el Valle de Güimar y en la costa sur. En Tenerife, el verano y otoño 2008 han tenido mayores humedades del aire que anteriores periodos estacionales. El invierno y verano han sido poco lluviosos y el otoño ha sido más lluvioso que anteriores periodos otoñales

MAPA DE LÍNEAS DE HUMEDAD MEDIA EN ENERO Y JULIO

Mapa esquemático de líneas de humedad media diaria en ENERO

La distribución de las humedades del aire en la isla está estrechamente relacionada con las variaciones de las presiones atmosféricas, orientaciones de las costas y laderas, y características orográficas del relieve. La costa, medianías del noroeste y cresterías del noreste son las zonas más húmedas de la isla, zonas de bosques de laurisilva donde las precipitaciones y nieblas son frecuentes. Las franjas costeras, medianías del noroeste a noreste y una pequeña superficie de medianías exteriores occidentales del Valle de Güímar son zonas húmedas, zonas boscosas de laurisilva y pinares donde las nieblas son frecuentes. Las medianías de la isla, excepto las medianías sur y la franja costera del sureste a sur son zonas semihúmedas, zonas de pinares; la zona costera está expuesta a vientos fuertes marinos de dirección noreste. Las medianías altas, zona de alta montaña y vertientes sur a suroeste son las zonas más secas. Las zonas central, noroeste y noreste de la isla carecen de estaciones agrometeorológicas.

Mapa esquemático de líneas de humedad media diaria en JULIO

La costa, medianías noroeste, medianías norte y cresterías del noreste son las zonas más húmedas de la isla, zonas de bosques de laurisilva donde son frecuentes las nieblas. Las franjas costera norte a noreste y sureste a sur, y medianías de la isla, excepto la franja este a sureste son las zonas húmedas, zonas boscosas de pinares y cultivos donde la nubosidad orográfica es frecuente. Las franjas de medianías altas, medianías y costa de las vertientes este a sureste, y costa oeste son las zonas semihúmedas, zona de pinares. La alta montaña es la región más seca, la zona no está expuesta a los vientos húmedos típicos en las islas Canarias. Las zonas central, noroeste y noreste de la isla carecen de estaciones agrometeorológicas.
